**Read the following passage carefully and select the most correct answers of the given questions:
 (Q. 26 to Q. 30)**

The functional declines of advancing age are depressing. The hearts ability to pump blood drops about one per cent: blood flows to arms and legs decrease by thirty to forty percentage in old age. The amount of air a person can exhale after a deep breath lessens and the chest walls stiffens with age. However, recent studies have shown that most of those age-associated declines can be delayed by exercise. Exercise lowers the resting heart-rate and increases the amount of blood pumped with each beat in older people. When stress is placed on bones through exercise, calcium content rises, with the result that resistance to fracture is improved.

26. Old age is generally a depressing period because
- (1) Old people worry more than others.
 - (2) Old people tend to regret their past.
 - (3) Various organs of the body function less efficiently.
 - (4) Old people do very little work.
27. The strength of bones can be increased by exercise, because it:
- (1) increases the amount of blood pumped by the heart.
 - (2) increases calcium content in bones.
 - (3) increase the amount of air exhaled by a person.
 - (4) lessens the stiffness of the chest wall.
28. The word 'exhale' means.
- (1) breathe in. (2) breathe out. (3) breathe slowly. (4) breathe fast.
29. Which one of the following statements is correct as per passage?
- (1) Exercise delays natural decay of old age.
 - (2) Old age problems increase due to exercise.
 - (3) Exercise increases the heart-beat which is dangerous.
 - (4) Exercise creates stress which is harmful to bones.

30. The chest wall becomes stiff in old age, because _____.
- (1) The heart's ability to pump blood to it drops about one percent.
 - (2) The blood flow to various organs decreases.
 - (3) The resting heart-rate becomes high.
 - (4) The person's ability to exhale sufficient air lessens.
